Research Proposal

Research Title:
From Feeds to Fatigue: How Social Media Algorithms Change Young People's News Habits and Reduce Diversity

IARCO - 2026

Scholar Name: Md. Jonaidul Islam
Institution: Bangladesh University of Professionals (BUP), Dhaka
Category: Senior
Year: Undergraduate (Mass Communication and Journalism)
Country: Bangladesh
Major: Mass Communication and Journalism
Email: nashitmdjonaidulislam@gmail.com

Date of Submission: September 21, 2026

1. Introduction

1.1 Background & Contextual Evolution

The modern media landscape is in the midst of a complete, structural transformation, marked by rapid shifts in media usage, away from traditional broadcast media and print journalism in favor of digital platforms and algorithms [1]. The youth world-wide are increasingly turning to social network feeds as a source of their news about current affairs, political discourse, and societal updates [1]. This paradigm shift has revolutionized the dissemination of information and has provided unprecedented speed, interactivity and multimedia engagement [1].

But this shift creates intricate system risks. Automated and algorithmic curation processes in modern platforms are designed, in large part, to attract and hold users' interest, often creating insular epistemic environments, or filter bubbles [3]. In the age of algorithmic content curation, users are becoming progressively trapped in a swirl of "personalized" content, which is carefully curated to reinforce their former thinking patterns and behavioral footprint [2]. This forms a new nexus between technology and sociology, in which the infrastructure of digital feeds directly influences cognitive patterns within humans and pluralism in society.

1.2 Problem Statement

Social media networks offer people a way to access information as soon as it happens, but their algorithmic architectures have a deep impact and can even be restrictive regarding the patterns of cognition, content preferences, and civic engagement of youth audiences [1]. The continuous screening of information creates invisible ideological and information barriers, protecting users from other or conflicting viewpoints and hindering their ability to think critically and balance their worldviews [3].

In addition, the fast-paced, continuous scroll nature of today's digital feeds fosters passive consumption patterns and leads to psychological depletion of younger news consumers. While the academic community has increasingly raised concerns about these phenomena, the need for empirical evidence to shed light on the impact of algorithmic curation on youth news diets and how and when it can lead to psychological exhaustion in developing mobile-first media environments such as Bangladesh is still significant. This study directly contributes to this gap by examining the complex mechanism between algorithmic exposure and informational diversity and cognitive fatigue.

2. Research Objectives

I. To systematically explore automated social media algorithms' influence on the news consumption habits, information-seeking behaviours, and news content preferences of university students.

II. To reflect on how the curation of information on platforms and the filter bubbles they create limit the experiences of young people by only offering them diverse versions of reality, cross-cutting debates and alternative narratives.
III. To examine the psychological and cognitive implications (mainly cognitive overload, cognitive fatigue, compulsive "passive scrolling") of non-stop immersion in the digital "food stream".
IV. To design and develop strategic, actionable and evidence-based policy and design recommendations for media educators, software architects and digital policy makers to promote cognitive diversity and sustainable media consumption habits.

3. Research Questions

RQ1: How do automated social media algorithms impact the daily news consumption of university students in specific ways?

RQ2: What are the overall impacts of filter-bubbles on young adults' access to a diverse range of perspectives and ideological debates produced by the platforms themselves?

RQ3: What is the relation between algorithm-driven news feed and how youth increase their passive scrolling behaviors and psychological fatigue?

4. Literature Review

Public communication and political socialization have been transformed from legacy media to algorithm-driven digital platforms [1]. A large body of academic work suggests that algorithms designed to personalize are structurally optimized to maximize engagement metrics, and often choose sensational, confirming, or polarizing content over comprehensive informativeness, meaning they tend to limit the variety of content [4]. The filter bubble is a concept that captures how users are trapped in closed epistemic environments, where users are separated from other viewpoints and potentially from views that are contrary to their own [3].

Alongside ideological entrapment, recent texts highlight the psychological costs that are imposed by the current digital media architectures. High-velocity and high-volume information streams are a constant occurrence that routinely cause cognitive overload, emotional distress and motivational burnout in busy digital audiences [4]. Observers of digital media have pointed out that recommender systems focus on user to user engagement and behavioral tracking, rather than civic utility, and thus tend to put users in a cycle of repeatable content that limits intellectual engagement [4].

Although there is much good work available on these dynamics in western democratic countries, there is an acute lack of research on how algorithmic news curation works in developing digital economies, where the young people who are using smartphones to access the news form the frontline of public talk [5]. Research into personalization algorithms reveals the important concept

of structural change in navigation of a discovery process, as well as the formation of long-term media habits over time among digital natives, which is an absolute necessity for an academic field of research [2]. The dynamics of these provide critical insight into young citizens' experiences of hyper-mediated environments without falling prey to informational isolationism or to psychological fatigue.

5. Methodology

5.1 Study Design

The study uses an exploratory qualitative approach to capture the subtleties of lived experiences, cognitive adaptations and subjectivity of young news consumers in algorithmic environments.

5.2 Data Collection Instruments

The study relies on two main instruments for collecting rich, multi-dimensional, and reliable qualitative data, namely:

- **In-Depth Interviews (IDIs):** IDIs are semi-structured one-on-one interviews with undergraduate students, done to gain in-depth understanding of individual cognitive interactions with algorithmic feeds.
- **Focus Group Discussions (FGDs):** Conducting 4 structured Focus Group Discussions (28 participants total) to witness group discussions and media norms/appropriation by peers and sharing of media.

5.3 Analytical Strategy

Data transparency and conceptual depth are facilitated by a rigorous thematic analysis approach. All of the audio data from the interviews and discussions is transcribed verbatim, then iteratively open and axial coded and summarized for the purposes of creating strong qualitative connections between feed exposure, narrowed news diets, and psychological fatigue.

6. Expected Outcomes & Significance

- A detailed mapping of young adults' behavioral strategies to cope with algorithmic overload.
- Some rich empirical evidence showing how auto filters are creating walls against pluralistic viewpoints.
- Detailed qualitative understanding of the cognitive moments that motivate passive scrolling and digital fatigue.

7. Novelty and Contribution

The study goes beyond the conventional media effects paradigms in directly linking algorithmic feed architectures to psychological sense of fatigue and narrowing information diet in the particular context of socio-cultural and digital landscape of Bangladesh. The results provide important, concrete information to the media literacy teacher, the sociologist, and the interface designer.

8. Limitations & Scope

- University students are the primary focus of the empirical sample, which might restrict the applicability of the results to older age groups and non-student youth groups.
- Self-reported qualitative data may overlook the subjectivity of the measures being taken, such as the amount of time spent on screens, and passive browsing.

9. Project Timeline

Phase / Duration	Key Activities & Milestone Deliverables
Month 1–2	Literature review completed, research instruments designed, validated, and received ethical approval, and pilot testing.
Month 3–4	20 in-depth interviews were conducted in the field with student participants, and 4 Focus Group Discussions were held.
Month 5–6	Verbatim audio transcription, systematic multi-layered thematic coding and comprehensive qualitative data interpretation.
Month 7	Aggregation of main conclusions, contextualisation and development of specific recommendations for stakeholders involved in digital.
Month 8	Final drafts of the manuscript, copyediting, formatting, compliance, and submission to journal/conference.

10. Conclusion

The aim of this research project is to study the dramatic shift in both structure and behavior of youth news consumption as a result of the impact of modern social media algorithms. The study utilizes a detailed qualitative approach, including in-depth interviews and focus group discussions, to illustrate the nature and impact of algorithmic curation and filter bubbles on information diets, the artificial barriers they create to different information, and the pervasive tendency to passively scroll and suffer from psychological fatigue. Finally, the expected results will provide important theoretical and practical insights for developing cognitive resilience and informational health in the digital era.
